

Your Hamiltonian

Any callable $H(l)$ returning
a Hermitian matrix, of any
size, or a constant one

hamiltonians, matter, earth

The worked scenarios and the
profiles they run through: PREM,
the Sun, NSI, LIV, sterile

oscprob

Sixty named wrappers
→ four scenario functions
→ `osc_prob` and its ladder
→ six engines, self-chosen

magnus

The expansion to order ten,
the quadrature, the slab
composition. No physics in it

↑ patches

avgprob, adiabatic

The routes that walk no
slabs: the phase average, and
transport along the eigenbasis

expmkernels

Compiled kernels:
the same numbers,
 $6.8\times$ faster
